

OTT Platform Analytics – StreamFlix

Scenario

You have joined StreamFlix, a leading OTT platform similar to Netflix, Amazon Prime, and Disney+ Hotstar, as a Junior Data Analyst.

The management team wants insights about:

- Most popular shows
- User engagement
- Regional performance
- Subscription revenue
- Content rankings
- Monthly platform growth

You have been provided with a viewership dataset and are expected to perform business analysis using PostgreSQL.

Part A: Database Setup

Create a table named: **ott_viewership**

Column Name	Data Type
view_id	SERIAL PRIMARY KEY
user_name	VARCHAR(50)
region	VARCHAR(30)
show_name	VARCHAR(50)
genre	VARCHAR(30)
watch_hours	INT
subscription_amount	INT
watch_month	VARCHAR(15)

Part B – Insert Dataset

user_name	region	show_name	genre	watch_hours	subscription_amount	watch_month
Rahul	North	Stranger Things	Drama	15	499	Jan
Neha	South	Money Heist	Crime	20	499	Jan
Vivek	East	Stranger Things	Drama	18	699	Feb
Priya	West	Wednesday	Drama	25	699	Feb
Amit	South	Money Heist	Crime	12	499	Mar
Riya	East	The Witcher	Fantasy	30	999	Mar
Karan	North	Wednesday	Drama	22	699	Apr
Sohan	South	Stranger Things	Drama	28	999	Apr
Pooja	West	The Witcher	Fantasy	16	499	May
Arjun	North	Money Heist	Crime	24	699	May
Meera	East	Wednesday	Drama	19	699	Jun
Rohit	West	Stranger Things	Drama	26	999	Jun

Business Objectives

Management wants answers to the following questions.

Task 1: Identify users who watched more than the platform's average watch hours.

Task 2: Determine whether any user from the West region watched "The Witcher".

Task 3: Identify regions where at least one user watched more than 25 hours.

Task 4:

Create a reusable query output/result table showing:

- Region
- Total Watch Hours
- Total Subscription Revenue

Store this query output/result table for future use.

Task 5: Rank all shows based on total watch hours.

Task 6: Assign a unique position to each user based on watch hours.

Task 7:

Rank all regions based on subscription revenue.

If two regions have the same revenue, they should share the same rank.

Task 8: For every month, display the previous month's subscription revenue.

Task 9: For every month, display the next month's subscription revenue.

Task 10:

Create a query output/result table that shows:

- Show Name
- Total Watch Hours
- Show Rank

Then display only the Top 3 shows on the platform.

Task 11:

Create a query output/result table that shows:

- Region
- Total Revenue
- Revenue Rank

Display only the Top 2 performing regions.

Task 12: Identify the most watched show in each region.

Task 13:

Write any three business insights from the dataset.

Example:

- Highest performing region
- Most watched show
- Most popular genre
- Month with highest subscription revenue
